

# On the Segmentation of a Simple Closed Curve<sup>1</sup>

Andrzej Trybulec  
University of Białystok

**Summary.** The main goal of the work was to introduce the concept of the segmentation of a simple closed curve into (arbitrary small) arcs. The existence of it has been proved by Yatsuka Nakamura [21]. The concept of the gap of a segmentation is also introduced. It is the smallest distance between disjoint segments in the segmentation. For this purpose, the relationship between segments of an arc [24] and segments on a simple closed curve [21] has been shown.

The papers [30], [35], [10], [3], [2], [29], [1], [13], [8], [9], [7], [4], [34], [25], [33], [22], [20], [28], [15], [26], [27], [18], [6], [12], [31], [19], [14], [16], [17], [23], [5], [24], [21], [11], and [32] provide the notation and terminology for this paper.

## 1. PRELIMINARIES

The scheme *AndScheme* deals with a non empty set  $\mathcal{A}$  and two unary predicates  $\mathcal{P}$ ,  $\mathcal{Q}$ , and states that:

$$\{a; a \text{ ranges over elements of } \mathcal{A} : \mathcal{P}[a] \wedge \mathcal{Q}[a]\} = \{a_1; a_1 \text{ ranges over elements of } \mathcal{A} : \mathcal{P}[a_1]\} \cap \{a_2; a_2 \text{ ranges over elements of } \mathcal{A} : \mathcal{Q}[a_2]\}$$

for all values of the parameters.

For simplicity, we follow the rules:  $C$  is a simple closed curve,  $p, q$  are points of  $\mathcal{E}_T^2$ ,  $i, j, k, n$  are natural numbers, and  $e$  is a real number.

The following proposition is true

---

<sup>1</sup>This work has been partially supported by the CALCULEMUS grant HPRN-CT-2000-00102 and TYPES grant IST-1999-29001.

- (1) For all finite non empty subsets  $A, B$  of  $\mathbb{R}$  holds  $\min(A \cup B) = \min(\min A, \min B)$ .

Let  $T$  be a non empty topological space. One can check that there exists a subset of  $T$  which is compact and non empty.

Next we state several propositions:

- (2) Let  $T$  be a non empty topological space,  $f$  be a continuous real map of  $T$ , and  $A$  be a compact subset of  $T$ . Then  $f^\circ A$  is compact.
- (3) For every compact subset  $A$  of  $\mathbb{R}$  and for every non empty subset  $B$  of  $\mathbb{R}$  such that  $B \subseteq A$  holds  $\inf B \in A$ .
- (4) Let  $A, B$  be compact non empty subsets of  $\mathcal{E}_T^n$ ,  $f$  be a continuous real map of  $[\mathcal{E}_T^n, \mathcal{E}_T^n]$ , and  $g$  be a real map of  $\mathcal{E}_T^n$ . Suppose that for every point  $p$  of  $\mathcal{E}_T^n$  there exists a subset  $G$  of  $\mathbb{R}$  such that  $G = \{f(p, q); q \text{ ranges over points of } \mathcal{E}_T^n: q \in B\}$  and  $g(p) = \inf G$ . Then  $\inf(f^\circ[A, B]) = \inf(g^\circ A)$ .
- (5) Let  $A, B$  be compact non empty subsets of  $\mathcal{E}_T^n$ ,  $f$  be a continuous real map of  $[\mathcal{E}_T^n, \mathcal{E}_T^n]$ , and  $g$  be a real map of  $\mathcal{E}_T^n$ . Suppose that for every point  $q$  of  $\mathcal{E}_T^n$  there exists a subset  $G$  of  $\mathbb{R}$  such that  $G = \{f(p, q); p \text{ ranges over points of } \mathcal{E}_T^n: p \in A\}$  and  $g(q) = \inf G$ . Then  $\inf(f^\circ[A, B]) = \inf(g^\circ B)$ .
- (6) If  $q \in \text{LowerArc}(C)$  and  $q \neq W_{\min}(C)$ , then  $E_{\max}(C) \leq_C q$ .
- (7) If  $q \in \text{UpperArc}(C)$ , then  $q \leq_C E_{\max}(C)$ .

## 2. THE EUCLIDEAN DISTANCE

Let us consider  $n$ . The functor  $\text{EuclDist}(n)$  yielding a real map of  $[\mathcal{E}_T^n, \mathcal{E}_T^n]$  is defined as follows:

- (Def. 1) For all points  $p, q$  of  $\mathcal{E}_T^n$  holds  $(\text{EuclDist}(n))(p, q) = |p - q|$ .

Let  $T$  be a non empty topological space and let  $f$  be a real map of  $T$ . Let us observe that  $f$  is continuous if and only if:

- (Def. 2) For every point  $p$  of  $T$  and for every neighbourhood  $N$  of  $f(p)$  there exists a neighbourhood  $V$  of  $p$  such that  $f^\circ V \subseteq N$ .

Let us consider  $n$ . Note that  $\text{EuclDist}(n)$  is continuous.

## 3. ON THE DISTANCE BETWEEN SUBSETS OF A EUCLIDEAN SPACE

The following proposition is true

- (8) For all non empty compact subsets  $A, B$  of  $\mathcal{E}_T^n$  such that  $A$  misses  $B$  holds  $\text{dist}_{\min}(A, B) > 0$ .

4. ON THE SEGMENTS

The following propositions are true:

- (9) If  $p \leq_C q$  and  $q \leq_C E_{\max}(C)$  and  $p \neq q$ , then  $\text{Segment}(p, q, C) = \text{Segment}(\text{UpperArc}(C), W_{\min}(C), E_{\max}(C), p, q)$ .
- (10) If  $E_{\max}(C) \leq_C q$ , then  $\text{Segment}(E_{\max}(C), q, C) = \text{Segment}(\text{LowerArc}(C), E_{\max}(C), W_{\min}(C), E_{\max}(C), q)$ .
- (11) If  $E_{\max}(C) \leq_C q$ , then  $\text{Segment}(q, W_{\min}(C), C) = \text{Segment}(\text{LowerArc}(C), E_{\max}(C), W_{\min}(C), q, W_{\min}(C))$ .
- (12) If  $p \leq_C q$  and  $E_{\max}(C) \leq_C p$ , then  $\text{Segment}(p, q, C) = \text{Segment}(\text{LowerArc}(C), E_{\max}(C), W_{\min}(C), p, q)$ .
- (13) If  $p \leq_C E_{\max}(C)$  and  $E_{\max}(C) \leq_C q$ , then  $\text{Segment}(p, q, C) = \text{RSegment}(\text{UpperArc}(C), W_{\min}(C), E_{\max}(C), p) \cup \text{LSegment}(\text{LowerArc}(C), E_{\max}(C), W_{\min}(C), q)$ .
- (14) If  $p \leq_C E_{\max}(C)$ , then  $\text{Segment}(p, W_{\min}(C), C) = \text{RSegment}(\text{UpperArc}(C), W_{\min}(C), E_{\max}(C), p) \cup \text{LSegment}(\text{LowerArc}(C), E_{\max}(C), W_{\min}(C), W_{\min}(C))$ .
- (15)  $\text{RSegment}(\text{UpperArc}(C), W_{\min}(C), E_{\max}(C), p) = \text{Segment}(\text{UpperArc}(C), W_{\min}(C), E_{\max}(C), p, E_{\max}(C))$ .
- (16)  $\text{LSegment}(\text{LowerArc}(C), E_{\max}(C), W_{\min}(C), p) = \text{Segment}(\text{LowerArc}(C), E_{\max}(C), W_{\min}(C), E_{\max}(C), p)$ .
- (17) For every point  $p$  of  $\mathcal{E}_T^2$  such that  $p \in C$  and  $p \neq W_{\min}(C)$  holds  $\text{Segment}(p, W_{\min}(C), C)$  is an arc from  $p$  to  $W_{\min}(C)$ .
- (18) For all points  $p, q$  of  $\mathcal{E}_T^2$  such that  $p \neq q$  and  $p \leq_C q$  holds  $\text{Segment}(p, q, C)$  is an arc from  $p$  to  $q$ .
- (19)  $C = \text{Segment}(W_{\min}(C), W_{\min}(C), C)$ .
- (20) For every point  $q$  of  $\mathcal{E}_T^2$  such that  $q \in C$  holds  $\text{Segment}(q, W_{\min}(C), C)$  is compact.
- (21) For all points  $q_1, q_2$  of  $\mathcal{E}_T^2$  such that  $q_1 \leq_C q_2$  holds  $\text{Segment}(q_1, q_2, C)$  is compact.

5. THE CONCEPT OF A SEGMENTATION

Let us consider  $C$ . A finite sequence of elements of  $\mathcal{E}_T^2$  is said to be a segmentation of  $C$  if it satisfies the conditions (Def. 3).

- (Def. 3)  $It_1 = W_{\min}(C)$  and it is one-to-one and  $8 \leq \text{len } it$  and  $\text{rng } it \subseteq C$  and for every natural number  $i$  such that  $1 \leq i$  and  $i < \text{len } it$  holds  $it_i \leq_C it_{i+1}$  and for every natural number  $i$  such that  $1 \leq i$  and  $i + 1 < \text{len } it$  holds  $\text{Segment}(it_i, it_{i+1}, C) \cap \text{Segment}(it_{i+1}, it_{i+2}, C) =$

$\{it_{i+1}\}$  and  $\text{Segment}(it_{\text{len } it}, it_1, C) \cap \text{Segment}(it_1, it_2, C) = \{it_1\}$  and  $\text{Segment}(it_{\text{len } it-1}, it_{\text{len } it}, C) \cap \text{Segment}(it_{\text{len } it}, it_1, C) = \{it_{\text{len } it}\}$  and  $\text{Segment}(it_{\text{len } it-1}, it_{\text{len } it}, C)$  misses  $\text{Segment}(it_1, it_2, C)$  and for all natural numbers  $i, j$  such that  $1 \leq i$  and  $i < j$  and  $j < \text{len } it$  and  $i$  and  $j$  are not adjacent holds  $\text{Segment}(it_i, it_{i+1}, C)$  misses  $\text{Segment}(it_j, it_{j+1}, C)$  and for every natural number  $i$  such that  $1 < i$  and  $i + 1 < \text{len } it$  holds  $\text{Segment}(it_{\text{len } it}, it_1, C)$  misses  $\text{Segment}(it_i, it_{i+1}, C)$ .

Let us consider  $C$ . One can verify that every segmentation of  $C$  is non trivial.

One can prove the following proposition

- (22) For every segmentation  $S$  of  $C$  and for every  $i$  such that  $1 \leq i$  and  $i \leq \text{len } S$  holds  $S_i \in C$ .

## 6. THE SEGMENTS OF A SEGMENTATION

Let us consider  $C$ , let  $i$  be a natural number, and let  $S$  be a segmentation of  $C$ . The functor  $\text{Segm}(S, i)$  yields a subset of  $\mathcal{E}_T^2$  and is defined by:

$$\text{(Def. 4)} \quad \text{Segm}(S, i) = \begin{cases} \text{Segment}(S_i, S_{i+1}, C), & \text{if } 1 \leq i \text{ and } i < \text{len } S, \\ \text{Segment}(S_{\text{len } S}, S_1, C), & \text{otherwise.} \end{cases}$$

The following proposition is true

- (23) For every segmentation  $S$  of  $C$  such that  $i \in \text{dom } S$  holds  $\text{Segm}(S, i) \subseteq C$ .

Let us consider  $C$ , let  $S$  be a segmentation of  $C$ , and let us consider  $i$ . Note that  $\text{Segm}(S, i)$  is non empty and compact.

We now state several propositions:

- (24) For every segmentation  $S$  of  $C$  and for every  $p$  such that  $p \in C$  there exists a natural number  $i$  such that  $i \in \text{dom } S$  and  $p \in \text{Segm}(S, i)$ .
- (25) Let  $S$  be a segmentation of  $C$  and given  $i, j$ . Suppose  $1 \leq i$  and  $i < j$  and  $j < \text{len } S$  and  $i$  and  $j$  are not adjacent. Then  $\text{Segm}(S, i)$  misses  $\text{Segm}(S, j)$ .
- (26) For every segmentation  $S$  of  $C$  and for every  $j$  such that  $1 < j$  and  $j < \text{len } S - 1$  holds  $\text{Segm}(S, \text{len } S)$  misses  $\text{Segm}(S, j)$ .
- (27) Let  $S$  be a segmentation of  $C$  and given  $i, j$ . Suppose  $1 \leq i$  and  $i < j$  and  $j < \text{len } S$  and  $i$  and  $j$  are adjacent. Then  $\text{Segm}(S, i) \cap \text{Segm}(S, j) = \{S_{i+1}\}$ .
- (28) Let  $S$  be a segmentation of  $C$  and given  $i, j$ . Suppose  $1 \leq i$  and  $i < j$  and  $j < \text{len } S$  and  $i$  and  $j$  are adjacent. Then  $\text{Segm}(S, i)$  meets  $\text{Segm}(S, j)$ .
- (29) For every segmentation  $S$  of  $C$  holds  $\text{Segm}(S, \text{len } S) \cap \text{Segm}(S, 1) = \{S_1\}$ .
- (30) For every segmentation  $S$  of  $C$  holds  $\text{Segm}(S, \text{len } S)$  meets  $\text{Segm}(S, 1)$ .
- (31) For every segmentation  $S$  of  $C$  holds  $\text{Segm}(S, \text{len } S) \cap \text{Segm}(S, \text{len } S - 1) = \{S_{\text{len } S}\}$ .
- (32) For every segmentation  $S$  of  $C$  holds  $\text{Segm}(S, \text{len } S)$  meets  $\text{Segm}(S, \text{len } S - 1)$ .

## 7. THE DIAMETER OF A SEGMENTATION

Let us consider  $n$  and let  $C$  be a subset of  $\mathcal{E}_T^n$ . The functor  $\emptyset C$  yielding a real number is defined by:

(Def. 5) There exists a subset  $W$  of  $\mathcal{E}^n$  such that  $W = C$  and  $\emptyset C = \emptyset W$ .

Let us consider  $C$  and let  $S$  be a segmentation of  $C$ . The functor  $\emptyset S$  yielding a real number is defined as follows:

(Def. 6) There exists a non empty finite subset  $S_1$  of  $\mathbb{R}$  such that  $S_1 = \{\emptyset \text{Segm}(S, i) : i \in \text{dom } S\}$  and  $\emptyset S = \max S_1$ .

We now state three propositions:

(33) For every segmentation  $S$  of  $C$  and for every  $i$  holds  $\emptyset \text{Segm}(S, i) \leq \emptyset S$ .

(34) For every segmentation  $S$  of  $C$  and for every real number  $e$  such that for every  $i$  holds  $\emptyset \text{Segm}(S, i) < e$  holds  $\emptyset S < e$ .

(35) For every real number  $e$  such that  $e > 0$  there exists a segmentation  $S$  of  $C$  such that  $\emptyset S < e$ .

## 8. THE CONCEPT OF THE GAP OF A SEGMENTATION

Let us consider  $C$  and let  $S$  be a segmentation of  $C$ . The functor  $\text{Gap}(S)$  yields a real number and is defined by the condition (Def. 7).

(Def. 7) There exist non empty finite subsets  $S_1, S_2$  of  $\mathbb{R}$  such that  $S_1 = \{\text{dist}_{\min}(\text{Segm}(S, i), \text{Segm}(S, j)) : 1 \leq i \wedge i < j \wedge j < \text{len } S \wedge i$  and  $j$  are not adjacent $\}$  and  $S_2 = \{\text{dist}_{\min}(\text{Segm}(S, \text{len } S), \text{Segm}(S, k)) : 1 < k \wedge k < \text{len } S - 1\}$  and  $\text{Gap}(S) = \min(\min S_1, \min S_2)$ .

Next we state two propositions:

(36) Let  $S$  be a segmentation of  $C$ . Then there exists a finite non empty subset  $F$  of  $\mathbb{R}$  such that  $F = \{\text{dist}_{\min}(\text{Segm}(S, i), \text{Segm}(S, j)) : 1 \leq i \wedge i < j \wedge j \leq \text{len } S \wedge \text{Segm}(S, i) \text{ misses } \text{Segm}(S, j)\}$  and  $\text{Gap}(S) = \min F$ .

(37) For every segmentation  $S$  of  $C$  holds  $\text{Gap}(S) > 0$ .
